The Comparison

Dieselcraft

1. Two magnets with eight north south poles. Double the square inches of fuel to magnet contact. Model 5-29 has 15 square inches and 22 square inches in the 30-200. The fuel is forced between the magnetic assembly and through the alternating north south poles to induce a small electric charge into the fuel.
2. Precision ground magnets manufactured to engineered and designed specifications.
3. The housing is precision machined and engineered to optimum fuel flow rates. The inside of the housing has a serpentine fuel path to mix fuel better. The overall spacing between the magnetic assembly and the housing are uniform and to the highest tolerances allowing interchangeability and uniform results.
4. Gold Anodized
5. Manufactured in our facility Richmond VA USA.

Algae-X

1. One magnet with single north south poles. Comparable models have half the square inches of fuel to magnet contact than Dieselcraft. The fuel flows loosely around the magnet and receives less benefit from induction.
2. Stock loudspeaker magnets.
3. The housing has a smooth fuel path and is made to looser tolerances to accommodate the loose tolerances of the cheaper magnet. The overall spacing between the single magnet and the housing are not uniform from one magnet to the next so interchangeability is possible but with varied results.
4. Clear Anodized.
5. Manufactured by an outside service.
